ZixCorp provides easy-to-use email encryption services for privacy and regulatory compliance. As the largest email encryption services provider, ZixCorp protects tens of millions of members in our ZixDirectory® and approximately 100,000 new members are being added every week. ZixCorp provides transparent, seamless secure communications with your customers, partners and regulators.
The Leader in Email Encryption Services

ZixCorp has built a trusted reputation with the nation’s most influential institutions through our easy-to-implement, -use and -maintain solutions. ZixCorp Email Encryption Services are based on Software-as-a-Service (SaaS) architecture, and ZixCorp distinguishes itself with convenient delivery methods that focus on both the sender and receiver experience.

Our solutions integrate seamlessly with existing email applications, and encryption keys are managed automatically. Through the only fully transparent delivery, ZixGateway® users send and receive encrypted email as they would conventional email. Workflow is not interrupted, and not even a password is needed.

ZixGateway also provides policy-based email encryption that automatically scans and encrypts outbound email if sensitive information is included within the subject line, body or attachments. Through automatic encryption, employees are alleviated of security burdens, and companies can ensure customer protection and regulatory compliance.

As an alternative, companies can offer employees the option to encrypt through ZixMail®. This desktop solution provides employees the choice to secure email with the convenience of a single click. Whether email is encrypted through ZixMail or ZixGateway, ZixCorp uses encryption standards, such as S/MIME, OpenPGP and TLS, to deliver secure email to anyone, anywhere.

Encrypt and Send to Anyone

No matter the recipient’s email encryption capabilities, ZixCorp Email Encryption Services deliver encrypted messages to anyone using the manner that works best for the end-user through our Best Method of Delivery™ (see figure below). For users without email encryption, ZixCorp provides two different methods, including a secure portal, or “pull,” method and a direct delivery, or “push,” method.
Email Encryption

Compliance Solutions
HIPAA, HITECH, GLBA, SOX, state data security laws and guidance from FFIEC agencies make it clear that protecting sensitive information is no longer optional. Securing your customers’ private information not only protects your organization from fines, lawsuits and negative publicity, it also improves customer trust. ZixCorp Email Encryption Services provide automatic detection and encryption of email containing personal health information (PHI) and nonpublic personal information. These proven policy tools can be customized to fit the needs of your organization’s email policies.

ZixDirectory and the ZixData Center™
ZixDirectory is the world’s largest email encryption directory, enabling seamless secure communication among its millions of members including some of the nation’s most influential institutions. Housed in the ZixData Center, it has the power to handle encrypted email for every email address in the world. The ZixData Center is SysTrust certified and SAS-70 type II accredited. ZixCorp takes pride in maintaining the highest levels of performance and has 99.99% availability that is guaranteed to customers through our service level agreements (SLAs).

Features
- FIPS 140-2 solutions

Email Encryption Products

ZixCorp Email Encryption Services have several optional components to meet the needs of any organization. Customers have the choice of a fully hosted solution or encryption gateways in their facility.

ZixGateway® is a policy-based email encryption gateway for privacy and compliance. Installed at the periphery of your network, ZixGateway automatically scans for sensitive information based on defined corporate policies. If sensitive information is found, it can be either blocked or sent encrypted. Policy-based encryption means the process is transparent to your users. ZixGateway supports a variety of delivery options including industry standards such as S/MIME, OpenPGP and TLS.

ZixMail® is a desktop application that integrates with any corporate or web-based email system and provides email encryption and decryption with the convenience of a single click.

ZixPort® uses clientless “pull” technology that sends encrypted email through a Web portal. It is ideal for companies that want to extend their brand by including secure email communications as part of their portal experience.

ZixDirect™ uses clientless “push” technology that sends encrypted messages directly to the recipient’s inbox. It is ideal for sending email securely to customers or business partners that do not have email encryption capabilities.

ZixConnect™ allows customers to securely communicate with their regulators and partners without the need for additional hardware or software at their facility. With just one secure TLS connection, customers are instantly connected to the ZixCorp email encryption network.

ZixAuditor® is a comprehensive email assessment service that enables organizations to identify email vulnerabilities, implement more effective policies and procedures, and monitor ongoing communications to ensure compliance.
